(1) The encoder can be set to zero at any position by means of a HIGH signal on the SET input. Once the SET function has been triggered, the encoder requires an internal processing time of typ. 300ms; during this time the power supply must not be switched off.

(2) The counter direction can be changed by means of a HIGH signal on the DIR input. If a LOW signal on the DIR input, output values are counted increase when the shaft is turning clockwise. And if a HIGH signal on the DIR input, output values are counted increase when the shaft is turning counter-clockwise.

## LED Status indication

2 LED status indicators can be built-in optionally.

**GREEN:** Power LED;

Lights up when encoder is powered up;

Turns off while SET buttons are pressed and turns on once the buttons are released.

**RED:** Lights Up as Alarm Indicator:

Measurement system degradation critical (encoder still working as intended) Memory failure in EEPROM Incorrect configuration data of the Opto-ASIC.

## Set buttons

The SET buttons which has the same function as SET input is optional.

Operation mode:

When the current value need to be set to 0, please press the SET button A and B at the same time, keep 1 second at least.
